**LARGE SPECIMEN****Brief Clinical History:**

Carcinoma descending colon.

**Specimen:**

Left hemicolectomy.

**Gross Description:**

Left hemicolectomy specimen measures 30.5cm in length. Externally, the colonic segment appears dilated over a length of 7.5cm. Serosa is unremarkable. The inferior mesenteric artery is marked by clips and measures 3.5cm in length. On cutting open, a circumferential ulceroproliferative growth is seen over a length of 4.6cm. This growth is at a distance of 11.4cm from one resected end and 14.0cm from other resected end.

- Serial sections across the growth show a solid grey white tumour which is extending upto a maximum depth of 3.2cm and is at a distance of 0.1cm from the nearest inked serosa. Grossly this tumour is seen extending beyond the muscularis propria, into the sub-serosa.

- Rest of the colonic mucosa appears unremarkable.

- Recovered 12 lymph nodes at the level of tumour, largest measuring 0.6 x 0.5cm. Cut surface is solid and grey white.

- Recovered 05 lymph nodes, from pericolic adipose tissue towards one resected end, largest measuring 0.5 x 0.4cm. Cut surface is solid and grey white.

- Recovered 04 lymph nodes from pericolic adipose tissue towards other resected end, largest measuring 0.4 x 0.4cm. Cut surface is solid and grey white.

- Recovered 02 lymph nodes along inferior mesenteric artery, largest measuring 0.2 x 0.1cm. Cut

surface is solid & grey brown.

A - One resected end, B - Other resected end, C to E - Tumour with maximum depth and nearest inked serosa, F - Tumour with adjacent normal mucosa, G to I - Tumour, J - Normal colonic mucosa, K to O - Lymph nodes at the level of tumour, P To R - Lymph nodes from adipose tissue from one resected end, S,T - Lymph nodes from adipose tissue from other resected end, U - Lymph nodes along inferior mesenteric artery, V- Adipose tissue along inferior mesentery artery.

#### agnosis/Comments:

Carcinoma colon, left hemicolectomy :

Tumour :

- Adenocarcinoma, moderately differentiated, grade 2.
- Tumour size : 4.6cm in length.
- Tumour infiltrates muscularis propria & into sub-serosa.
- Lymphovascular invasion : present.
- Perineural invasion : absent.
- Tumour bud score : intermediate.
- Necrosis : present within tumour islands.

Margins :

- Proximal & distal resected margins are free of malignancy.
- Serosal surface is focally close, <0.1cm.

Lymph nodes :

- 21 pericolic lymph nodes recovered with 9 showing metastatic adenocarcinoma (9/21).

- Size of largest deposit : 0.7cm.

- Extranodal extension : not seen.

- 2 lymph nodes recovered along inferior mesenteric artery with no evidence of malignancy (0/2).

- Pathologic stage : Atleast -pT3 pN2b.
